**Abstract**

A games machine of the coin-operated 'slot' machine type has symbol carriers (10) that are rotated in a pseudorandom cycle. The system is operated by a controller (11) containing a microprocessor (12). The system has an I/O unit coupled to an identification card (26) reader (23) and a number of displays (18-21). The card is inserted into the reader and an identification code is entered and a balance locator, e.g. (53), in memory is assigned. Win values are entered into this location and are accumulated. When a specific amount is reached an improved game possibility is generated.  
 ADVANTAGE - Improves jackpot.
